

School should use more practical experiments instead of relying mainly on textbooks.

I agree because in my opinion if school use more practical experiments during the class. Instead to use the textbooks to learn mostly academic knowledge I believe using more practical Experiments can help student understand more on the topic which they are learning on the Textbook also I think use more experiments can let students had more individual think On the knowledge which on the textbook. For example when the students are learning the science, Geography and history when they are leaning the knowledge on the textbook they Are just understand the Knowledge by read the textbook, listening to the teacher on the Lesson and doing the question on the textbook but I believe if the students had more Chance to have more science experiment or more practical experiments at geography or History to observe to touch also to feel it as well however I believe If school use more Practical experiments instead of relying mainly on textbook can help student understand More which the knowledge written on the textbook. So summarise the text I agree school should use more practical experiments instead of relying mainly on textbooks.

② I agree with this view

Schools should use more practical activities rather than replying mainly on textbooks.

I agree with this view because, if schools use more practical activities during class, students can gain a deeper understanding of the subjects they study. Instead of learning academic knowledge only from textbooks, they can apply that they have learnt in real situations [real life scenarios]. I also believe that practical work encourages [motivate] students to think independently about information presented in textbooks.

For example, in science, geography, and history lessons, students often learn by reading textbooks, listening to the teacher, answering questions. However, schools could give students more opportunities to conduct science experiments and carry out geographical fieldwork. Through these activities, students can observe, investigate and experience ideas directly. As a result, students could understand and remember what they have learnt.
